

PSA

PSA air purifier

The PSA air purifier is perfect for purifying supply air when background levels are high and excellent purity is required.

PSA is typically used in industrial applications for protecting electronics and electrical devices from corrosion caused by the surrounding air. It is also perfect for purifying compressor intake air and eliminating odors in wastewater systems.

The PSA air purifier is modularly constructed and allows the building of one or more chemical filtering stages using C-12 filter sections. Pre- and post-filtering can be added.

Purifier unit

Standard material: acid-resistant steel plate
 Connection: flange joint with counter flanges

Filter sections

Filter section type: C-12
 Main dimensions: 300 x 300 x 300 mm
 Medium volume: approx. 15 dm³
 Material: ABS plastic

Fields of use

- + Electrical rooms
 - + Composting plants
 - + Wastewater pumping stations
- + Data centers
 - + Protection of electronics
 - + Compressor intake air
- + Wastewater treatment plants
 - + Control rooms

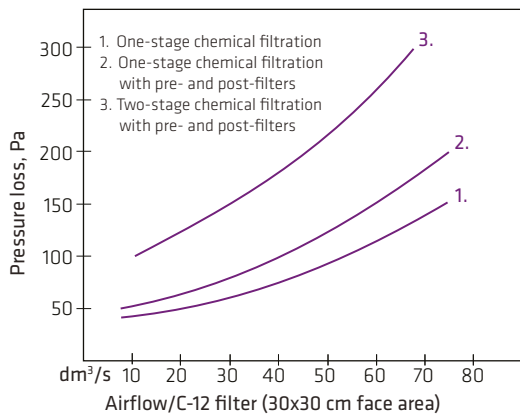

Other equipment

Pre-filter: filtration class M6
 Post-filter: filtration class F9

Scaling

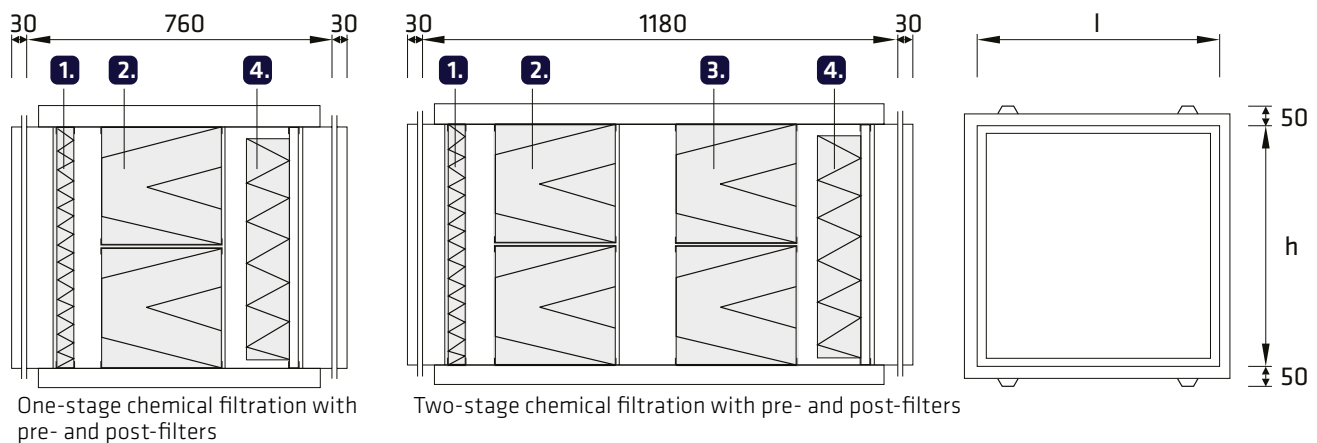

The contaminant removal efficiency of PSA air purifiers is over 99%. The delay of the air flow in the filtration material is normally scaled between 0.25 and 1.5 seconds. The minimum delay per filtration stage is 0.25 seconds.

Pressure loss data
